

# Important: Please Read Before Installation of the Spa System.

The non-return valve supplied is not to be used as a failsafe to prevent water returning back to the pump; it should be situated close to the manifold and is not to be used to stop water returning to the pump.

You should situate the pump above the water level of the bath as this completely eradicates any chance of water flowing back to the pump.

If you cannot put the pump above the level of the bath then you should use the fittings supplied to create an anti-syphon with the pipe work taken above the water level so that this prevents any water from flowing back to the pump.
